

SmartCode Workflow and Operations Diagrams

Diagrammatic view of how SmartCode traffic, deploys, bugs, and data move through the current production setup.

User request flow

Flow summary: users interact with the Vercel frontend, which calls the Render backend. The backend persists state in MongoDB Atlas and optionally calls OpenAI only for the coach feature.

Deploy workflow

Bug triage workflow

Always begin with browser reproduction. It is the fastest way to separate frontend, backend, and data bugs before you spend time on the wrong layer.

Data lifecycle

Read path

Frontend requests dashboard or problem routes; backend responds with JSON from MongoDB-backed logic.

Recovery

Use Atlas backups plus a known-good GitHub commit when code and data both need recovery.
